Legend:

Three dots (...) instead of a figure means that the data has not (yet) been gathered or calculated.

A dash (-) instead of a figure is used for the value absolute zero.

A figure indicated with a superior "p" means that this figure is provisional.

Abbreviations for names of cantons:

These are explained in the table on page 4.

Rounded figures:

In general, figures are rounded up or down, which may cause the sum of rounded figures to differ from the end total.

Dear readers,

Here is the 20th edition of Statistical Data on Switzerland, one of the Federal Statistical Office's flagship publications. It is published every year at the same time as the Statistical Yearbook of Switzerland, which is a lengthier publication containing 600 pages.

There are a few new features in this 2016 edition. The "sustainable development" chapter includes previously unpublished data on population services. These data make it possible to see whether a given location has optimum access to infrastructure, establishments and services that are of importance to the population such as restaurants, schools, medical practices etc. They provide information on the quality of life and highlight the differences between the regions. The "space and environment" chapter has been largely reworked. This year it presents the use of resources and greenhouse gas emissions and a chart on the population's perception of environmental conditions. The "mobility and transport" chapter contains new information on the cost and financing of road, railway and air transport.

Among the statistics developed by the FSO, survey data may call for longer or more complex processing depending on the circumstances. As a result, survey data are not necessarily based on the same year. In many cases, they are based on data from 2014 or even 2015 whereas others are from previous years. Nonetheless, the results published are always the most recent. You can also consult the most recent figures for a topic at any time in our online offerings.

2016 will also bring a number of changes for the FSO, notably with the going live of the new statistics portal. The more modern and interactive website is adapted to the latest technology, including mobile devices. Furthermore, a new type of publication was also developed in the area of mobile end devices in 2015: digital publications, i.e. DigiPubs. One of the first DigiPubs covered the National Council elections. Other topics will be published in DigiPub format during 2016.

Georges-Simon Ulrich

Director General
Federal Statistical Office (FSO)

The population is mostly urban

84.5% of the population (2014) live in urban areas. About half of the urban population live in one of Switzerland's five largest agglomerations (Zurich, Geneva, Basel, Bern and Lausanne).

Population growth has been higher in urban areas than in rural areas (2014: +1.2% compared with +1.0%).

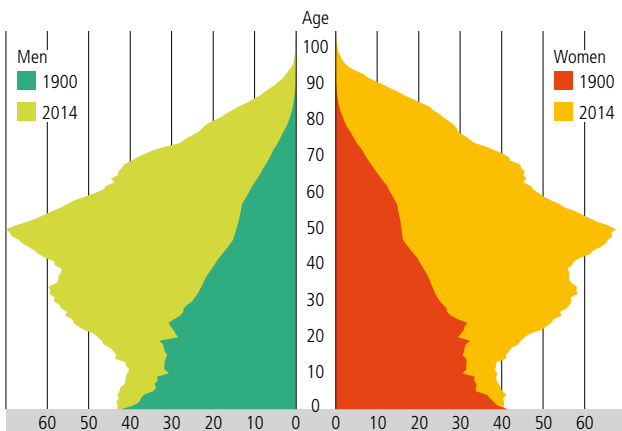

Population growth, 2010–2014

by district

Age structure of the population

Number of persons in '000

Ageing society

During the course of the 20th century, the proportion of elderly people increased, while that of young people (under age 20) and people of working age (aged 20–64) declined. As a result of this process, the shape of the age “pyramid” has been transformed into one of a “fir tree” (2014) in which the baby boom generation (born between 1960 and 1971) predominates. The ageing of the population will continue. The proportion of persons aged 65 and over is expected to rise from 17.8% (2014) to 28% in 2060. Switzerland’s population growth in recent years is mainly attributable to net immigration and to a lesser extent to an excess of births over deaths.

Children born alive, 2014

Total	85 287
Boys for every 100 girls	105.8
Proportion of children out of wedlock in %	21.7
Children per woman ¹	1.5

Non-attributable	7.7

Foreign permanent resident population by nationality, 2014

Acquisition of Swiss citizenship

1 Number of citizenship acquisitions per 100 holders of annual and permanent residence permits at the beginning of the year

Foreign population: more than half were born in Switzerland or have been residents for at least 10 years

Foreigners account for 24.3% of the permanent resident population. More than half of the residents without a Swiss passport (55.5%) have been living in Switzerland for 10 years or more or were born here. In 2014, 32 836 persons (1.8% of the foreign permanent resident population) obtained Swiss citizenship. The foreign population is young: for every 100 foreigners of working age (aged 20–64) there are only 11 aged 65 and over (compared with 36 among the Swiss) in 2014. 28.8% of children born in Switzerland in 2014 had foreign citizenship. In 2014, the number of immigrations decreased by 3.1% compared with the previous year. Of these immigrants, 62% came from EU/ EFTA countries.

Increasingly multifaceted living patterns

In 2013, only 29% of private households belonged to the household type "Couple with child(ren)". Of the households with at least one child under 25 years 14% are lone parent families and 6% patchwork families. These high figures are the result of a great number of divorces (16 737 in 2014). Furthermore the proportion of non-marital births almost doubled between 2000 and 2014, from 11% to 22%.

The decision to get married and start a family is being made increasingly late in life: The age at first marriage among women rose from 24 (1970) to 30 (2014) and among men from 26 to 32 years; the average age of mothers at first birth rose from 25 to 31 years.

The traditional middle-class "single breadwinner" model is now the exception: In 2014, almost eight in ten mothers (78,5%) in couple households were in employment. It still holds true that fathers tend to do more paid work (generally full-time) and mothers are mainly responsible for house and family work.

Private households, 2013

	in '000
Total	3 532.6
Single-person households	1 240.6
Family households	2 184.0
Childless couples	975.2
Couples with children	1 019.7
Lone parents with children	203.3
Non-family households	70.3

Family households with children, 2013

Main languages, 2013¹

	in %

Other Christian communities	5.8
Jewish religious community	0.2
Islamic religious communities	5.1
Other churches and religious communities	1.3
No affiliation	22.2
Unknown	1.3

² Resident permanent population aged 15 or more and living in a private household

Use of resources and emissions

Index 1990 = 100

A growing population and economy are usually accompanied by a rise in the consumption of natural resources and an increase in emissions – unless behaviours change or technological advances lead to improved efficiency. Energy and land consumption, for example, tend to grow at roughly the same rate as the population in the same way that the volume of municipal waste keeps step with GDP. Greenhouse gas emissions, on the other hand, have remained more or less constant since 1990. Water consumption and material consumption have even decreased despite the needs of a growing population and economy.

Land use

Period of survey 2004–2009

	km ²	%
Total surface area	41 285	100
Forest and woods	12 931	31.3
Farmland	9 678	23.4
Alpine farmland	5 139	12.4
Settlement and urban areas	3 079	7.5
Lakes and watercourses	1 769	4.3
Other natural space	8 690	21.0

Within 24 years, settlement and urban areas have grown by 23%, mainly at the expense of agricultural areas. According to the latest figures, settlement and urban areas constitute 7.5% of Switzerland's surface area and 4.7% of the surface is sealed.

Change in land use

in square metre per second

Temperature fluctuations

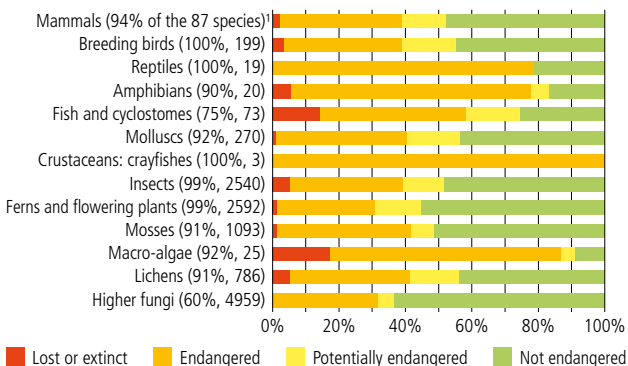

Deviations from long-term mean value 1961–1990, in °C

The air temperature varies from year to year and is characterised by colder and warmer periods. 10 out of 11 of the warmest years in Switzerland since records began in 1864 have been in the 21st century and 2015 was the warmest year so far.

Endangered animals and plants (red lists)

Status 1994–2014, depending on the species group

1 Reading aid: The endangerment status was assessed for 94% of the 87 mammal species. Data are deficient for the remaining species.

There are around 46 000 known species of flora, fauna and fungi in Switzerland. Of the species examined, 36% are on the red list, i.e. they are considered endangered, missing or extinct.

Perception of environmental conditions in the place of residence, 2015

Share of population

In 2015, 24% of the population found traffic noise at home with open windows to be very or rather disturbing. 19% were of this opinion with regard to air pollution surrounding the house and 10% with regard to radiation from power lines or mobile telephony antennas. These perceptions approximately correspond to those observed in 2011.

Environmentally related taxes revenue

CHF billion, at current prices

Environmentally related taxes make environmentally damaging goods and services more expensive and encourage consumers and producers to think about the consequences of their decisions. In 2014, environmentally related taxes revenue corresponded to 6.1% of the total tax and social contributions.

1 As of 1.6.2002 seasonal work permits are no longer issued

Considerable increase in women's participation in labour market

Between 2010 and 2015, the number of women in employment increased at a much greater rate than that of employed men (+10.3% to 2,273 million compared with +6.8% to 2,703 million). Part-time employment has also been increasing for many years. In 2015, 59.8% of women were working part-time (2010: 58.6%). In contrast, 16.4% of men worked part-time, although this percentage has also increased since 2010 (+2.7 percentage points). The increase in women's labour force participation and in part-time employment can be attributed to the tertiarisation of the economy. 86.8% of women in employment in 2015 worked in the tertiary sector (men: 64.9%) and part-time employment is mainly found in the service sector (9 out of 10 part-time jobs).

Foreign workers

Foreign workers are an important factor in the Swiss labour market. Since the 1960s, their share of the labour force has always exceeded 20%; in 2014, it was 29.9%. Foreign labour is particularly important in the industrial sector (2014: 38.9%; Service sector: 28.0%).

In 2014, 78.4% of foreigners in employment were citizens from an EU or EFTA country. Two thirds of the permanent resident population from the EU came from Germany (25.4%), Italy (21.4%) and Portugal (20.5%).

Foreign trade the main source of GDP growth in 2014

Economic activity in Switzerland in 2014 measured by GDP again recorded sustained growth of 1.9% compared with 1.8% in 2013 (variation at previous year's prices).

More than half of GDP growth in 2014 was due to foreign trade and in particular to the good results of the balance of goods (excluding non-monetary gold). Sales abroad from the pharmaceutical, watch and jewellery industries registered strong growth. Conversely, due to the sharp increase in business service imports, licence fees and tourist expenditure abroad, the balance of services declined and did not contribute to growth.

Also in terms of demand, final consumption slowed down (+1.3% compared with +2.1% in 2013), reflecting the deterioration of household consumer confidence, while investments registered a marked increase (+2.1%), mainly from the construction sector.

On the production side, GDP growth was mainly generated by the manufacturing industry, construction and non-financial services such as health and telecommunications. Conversely, the growth of the financial sector (banks and insurances) subsided following the sharp rise of 2013.

Gross domestic product (GDP) and its components

Importance of relations with the rest of the world

From 1997, foreign trade played a leading role in the growth of the GDP. In fact, the periods of strong growth have coincided with booming foreign trade. Exports are the component of the GDP which made the largest contribution to growth during the prosperous years (1997 to 2000 and 2004 to 2007). One of the consequences of the dynamism of exports was an increase in the share of the foreign contribution (balance between exports and imports) to the GDP, showing the growing significance of the rest of the world to the Swiss economy. In 2009, however, Switzerland suffered the brunt of the slowdown in the global economy, which resulted in a negative contribution by foreign trade.

Since the financial crisis of 2008, foreign trade's contribution to growth in GDP has become more erratic. The increasing importance of the rest of the world is also evident in the investment income earned abroad, which has also played an increasingly significant role in determining gross national income (GNI), which is generally more

dynamic than the GDP. The years 2008 and 2011 stood out because GNI was exceptionally less dynamic due to losses posted by Swiss bank subsidiaries abroad in 2008 and currency exchange effects in 2011. In 2014, the GNI did not only decline (-1.3%) but was lower than the GDP. This deterioration was due to the considerable increase in investment income paid abroad concerning direct foreign investments in Switzerland, portfolio investment income as well as the growth of salaries paid to cross-border workers.

Share of the external sector in GDP
at current prices

GDP and GNI at current prices
in CHF billion

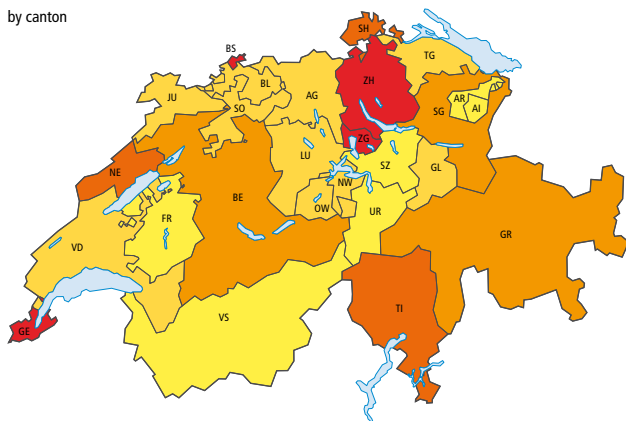

Once economic activity measured by GDP is known, one can investigate the efficiency with which productive resources (labour and capital) are utilised. Labour efficiency is measured by hourly labour productivity, i.e. the value added created by hour worked.

More than 99% of enterprises are SMEs

More than 99% of all enterprises in Switzerland are small and medium-sized enterprises (SME) i.e. enterprises with fewer than 250 employees. The proportion of micro-enterprises (with fewer than 10 employees) in 2013 is larger in the service sector than in the secondary sector (92.9% compared with 82.5%). The average size of enterprises also differs accordingly (service sector: 9 employees; secondary sector: 12 employees). Approximately two thirds of employees work in SMEs; around one third in large enterprises (with fewer than 250 employees). Slightly more than a fourth of jobs (28%) are accounted for by micro-enterprises and around a fifth (19%) by enterprises with 10 to 49 employees. In 2013 the share of total employment represented by the tertiary sector in the case of private enterprises was 70.8%. Overall in private enterprises around 160 000 employees worked in the primary sector 1 098 000 in the secondary and 3 045 000 in the tertiary. The healthcare and retail sectors counted the most employees in private enterprises (359 000 and 352 000 employees respectively).

Company size¹, 2013

¹ Only market-oriented companies. The size of a company is determined by the number of full-time equivalents (part-time positions are added together to make full-time posts)

Production in the secondary sector

Indexed change in the quarterly results
Annual average 2010=100

Overall production in the secondary sector (excluding the construction industry) grew by 31% between 2004 and 2014. The trend is highly cyclical. In the positive economic climate of 2005 to 2007, production rose considerably. It plummeted again during the financial crisis at the end of 2008. But in 2010 the situation began to improve. In 2010 Swiss production had regained the index level of 2007.

Labour costs

Labour costs are the costs incurred by enterprises for the production factor of labour. They generally account for a large proportion of the production costs for goods and services. Labour costs are composed of gross wages and salaries (79.1%), social contributions from employers (17.6%) and other costs, particularly those associated with vocational training and personnel recruitment (3.3%). In 2012 the average cost per hour worked for enterprises in the secondary and tertiary sector was CHF 61.30 overall.

Labour costs are one of the most important indicators for estimating the attractiveness of different national business locations and can vary considerably from country to country. In 2012 due to the strength of the Swiss franc (2012 Euro exchange rate: CHF 1.21), the average cost per hour worked in Switzerland in enterprises with ten or more employees reached Euro 51.25. In Switzerland's neighbouring countries of Austria, Germany and France, the average cost per hour worked was Euro 29.75, Euro 30.50 and Euro 34.25.

Foreign trade: our key partners, 2014

in CHF billion

Switzerland is one of the countries in which foreign trade represents the highest share of gross domestic product (GDP). Its most important trading partners in 2014 were the industrialised countries that accounted for 59.9% of exports and 76.3% of imports. The EU plays a particularly important role in this respect (45.0% of exports and 66.1% of imports).

Agricultural areas and forest and woodland account for 36% and 31% respectively of Switzerland's territory. The landscape is therefore in large measure shaped by agriculture and forestry. These two sectors are important not only for food production, construction materials and renewable energy, but also for maintaining decentralised economic activity and for protecting landscape diversity and biodiversity. In 2014, the share of both sectors in the gross value added of the Swiss economy was 0.8%.

Logging

in million m³

Total energy use and final consumption, 2014

¹ Incl. export surplus of electricity (1.8%)

Increased consumption

Final energy consumption is closely linked to economic development and population growth. Increasing numbers of inhabitants, larger dwellings, growing production, rising consumerism, heavier motor vehicles etc. lead to increased energy consumption unless this is compensated for by greater energy efficiency. In 2014, transport was the largest consumer group with narrowly 38% of the final energy consumption. 65% of the final consumption were covered by fossil fuels and 21.4% came from renewable energies, mainly hydropower.

² As of 2009 the housing stock is calculated on the basis of the Buildings and Dwellings Statistic (BDS)

Trend towards single-family houses

Single-family houses as a percentage of total building stock rose from 40% to 57% between 1970 and 2014. 60% of newly constructed buildings for housing purposes are single-family homes in 2013.

Continuous increase in the home ownership rate since 1970

At the end of 2013, 37.5% of households in Switzerland lived in their own dwelling. This corresponds to 1 325 707 households. Since 1970 the home ownership rate has risen continuously (1970: 28.5%, 1980: 30.1%, 1990: 31.3%, 2000: 34.6%). The number of dwellings in condominium ownership has shown the greatest increase. Their number rose from 237 700 to 404 876 between 2000 and 2013 (+70%). However, the majority of privately owned dwellings continue to be composed of households who own the house in which their dwelling is located (2000: 809 700, 2013: 920 831).

Travel behaviour

In 2014, 87.5% of people over 6 years old living in Switzerland undertook at least one private trip with overnight stays. To be more precise, each person undertook on average 2.9 trips with overnight stays and 10.3 day trips. More than half (56%) of all trips with overnight stays were long trips (minimum 4 overnight stays). Trips abroad represented 63% of trips with overnight stays and 10% of day trips.

Infrastructure

Transport infrastructure covers around a third of the settlement and urban areas in Switzerland (according to the Land use statistics from 2004/09).

In 2014, the length of national highways was 1823 km (of which motorways comprised 1429 km), that of cantonal roads 17 933 km and that of communal roads 51 797 km (as at 1984). In 2010, the railway network covered 5124 km.

Costs and funding of transport

In 2010, road, rail and air traffic in Switzerland generated total costs of CHF 94.3 billion. In addition to expenditure on infrastructure and means of transport, this also included the cost of accidents and costs for transport-related damage to the environment and health.

The three tiers of the social security system

Social security in Switzerland is based on a three-tier system:

- In addition to individual means of subsistence (remuneration from work, fortune etc), the first tier includes the coverage of basic needs. It is available to everyone and includes the education and legal system as well as public security.
- The second tier includes all social insurances and is intended to cover risks such as old-age, illness, disability, unemployment and maternity.
- The third tier includes all means-tested social benefits. These are the last level in the social security system. They are only called upon when benefits from other social insurances are unavailable or are exhausted. Furthermore recipients must be in a situation of need: They are only paid to persons in modest financial situations.

Before social assistance is called upon, a series of other benefits are available in the third tier, aimed at avoiding dependence on social assistance. These can be divided into benefits which guarantee the basic existence needs (e.g. grants or free legal aid) and complementary benefits which supplement insufficient or expired social insurance provisions or lack of private insurance.

Total expenditure on social security

In 2013, total expenditure on social security amounted to 171 billion francs. 154 billion can be attributed to actual social benefits. About four fifths of these are spent on social insurances (the second tier of the social security system).

Rising expenditure on means-tested social benefits

In 2012, net expenditure on means-tested social benefits in Switzerland totalled CHF 12.7 billion, i.e. approximately CHF 438 million more than in the previous year (+3.6%). Two thirds of this expenditure were accounted for supplementary benefits relating to old-age and survivors/invalidity (AHV/IV) insurance (CHF 4.4 billion) and to the health insurance premium reduction (CHF 4.2 billion). Following in third place was social assistance narrowly defined, with a net expenditure of CHF 2.4 billion. Social assistance expenditure thus showed a nominal rise of 14.4% compared with the previous year.

Expenditure per social assistance beneficiary rose by 7.9% from CHF 8781 in 2011 to CHF 9473 in 2012.

The cantons were the principal disbursers of means-tested social benefits. In 2012, 43.9% of net expenditure was borne by the cantons, 32.2% by the Confederation (mainly for premium reductions, supplementary benefits (EL/PC) and social assistance in the asylum and refugee sector), and 23.5% by the communes.

Net expenditure on means-tested social benefits

In CHF billion (current prices)

Social assistance

In 2014, 261 983 persons, 3.2% of the total population, were supported by social assistance. There are considerable regional differences: the highest rates are found in larger and medium sized towns with a distinct inner-city character. Groups of persons who are to a greater degree dependent on social assistance are over-represented in these towns. This includes for example, single parents, foreigners and the long-term unemployed.

The risk of becoming reliant on social assistance varies greatly depending on a person's age, family structure and nationality.

Social assistance rates are highest among children and young people under 18. In general, rates tend to diminish with increasing age. They are lowest (social assistance rate 0.2%) among persons aged 65 and over, who receive support when needed from the OAS supplementary benefits.

Life expectancy

Life expectancy has shot up during the last century, largely as a result of falling infant and child mortality. Life expectancy has also continued to increase in recent years. Since 1991 it has risen for women by 4.0 years and for men by 6.9 years (2014). Men tend to die earlier (before the age of 70), mainly due to ischemic heart disease, accidents and violence, as well as lung cancer.

Self-rated health

In 2012, 84% of men and 81% of women described their health as good or very good and only 4% of men and women qualified it as bad or very bad. However, temporary physical and mental problems seem to affect work and everyday life. Swiss inhabitants were unable for health reasons to go to work or to carry out work at home for an average of 13 days in 2012.

Consumption of alcohol, tobacco and illegal drugs, 2012

Illegal drugs are mainly used by teenagers and young adults. In 2012, approximately 11% of 15–39 year-olds consumed cannabis. Much more serious from the public health angle is the consumption of tobacco and alcohol. About 28% of the population as a whole smoked at the time of the survey in 2012: 24% of women and 32% of men. The percentages have fallen slightly compared to 1992, but in comparison with the 2007 Health Survey, they have remained stable. The percentage of people drinking alcohol every day has fallen to 13% (1992: 20%). 17% of men and 9% of women consumed alcohol on a daily basis.

Health care costs

In 2013, 10.9% of the GDP went on health (1990: 7.9%). Development of supply is a fundamental factor in this increase: e.g. expanded facilities, growing specialisation and greater use of technology, and greater comfort. The impact of the ageing population is not so significant.

Moving towards a Swiss educational system

Switzerland's education system is characterised by strong federalism. The diversity of the different education systems is particularly noticeable in compulsory schooling: depending on the canton, in lower secondary schools for example, there are two, three or four different performance levels.

The Swiss education system is changing. Along with the harmonisation of compulsory education, children will be expected to attend school for eleven instead of nine years. In most cantons, attendance at the previously optional pre-school level is now compulsory. In the last two decades, the national structures have also been reformed beyond compulsory education (introduction of the vocational Matura and the universities of applied sciences as well as the implementation of the Bologna reform). These reforms are also reflected in increasing demand for education.

¹ Including universities for teacher education

The gender gap has narrowed

Women have been the main beneficiaries of the educational boom in recent decades. Today almost as many women as men undertake and complete post-compulsory education or vocational training. Whereas the gender ratio in the universities and universities of applied sciences is now almost even, men are still more likely than women to complete higher vocational education. Accordingly, on average men still remain longer in education than women. Conversely, girls are more successful in compulsory education: they are transferred to a special class less frequently and at the lower secondary level they attend schools with higher educational requirements.

Particularly striking differences still exist in the choice of subject area. This applies to both vocational training and university. Job sectors are dominated by either men or women, not least due to traditional role models. In the industry and handicrafts sector, men predominate; in the retail, health and personal care sectors, women are in the majority. At the university level men still tend to opt for technical, scientific and business fields, while women choose the humanities, social work and the arts.

Increased participation in education

Over the past thirty years the participation in education at upper secondary level and especially at tertiary level has risen considerably. Educational courses giving access to universities are particularly concerned. The percentage of people taking the Matura examinations for example (vocational Matura and academic Matura) rose from 25.7% in 2000 to 37.5% in 2014 (including specialised Matura). The number of students almost doubled between 2000 and 2014. This is in no small part due to the establishment of the universities of applied sciences and teacher education.

In accordance with this development the educational level of the Swiss population is expected to rise considerably in the coming years. The percentage of persons with a tertiary-level qualification in the population groups aged 25–64 is expected to rise from 40% in 2014 to 50% by 2027.

Further education

A distinction is made here between two types of further education – non-formal education (such as attending courses, seminars, private tuition and conferences) and informal study (includes specialised literature, study with aid of CD-ROM or from family members). The majority of the population in Switzerland (nearly 80% of the permanent population aged 25–64) undertook further education in one form or another in 2011. It appears that the integration in the labor market and the level of education are positively associated with participation in continuing education courses.

Focus on research

Research and development (R&D) is an important factor for a national economy. With 2.96% of its GDP being spent in this area (2012), Switzerland is one of the most R&D-oriented countries in the world.

In 2012 around CHF 18.5 billion was spent on domestic R&D. Of this, around 69% was in the private sector, 28% in universities and the remaining 3% was divided between the Confederation and various private, non-profit organisations.

Private sector expenditure abroad amounted to CHF 15 billion in 2012 and is slightly higher than the inland expenditure of CHF 13 billion.

The Swiss press in upheaval

The market for daily newspapers has changed fundamentally since the turn of the century. In German-speaking Switzerland, the free-of-charge commuters' newspaper "20 Minuten" has become the largest daily with over 1.5 million readers per edition. In French-speaking Switzerland, "20 minutes", with 535 000 readers, has also become the most widely read title. In Italian-speaking Switzerland, a newsstand newspaper, the "Corriere del Ticino plus", is still the leading daily (129 000 readers). However, "20 minuti", which was launched in September 2011, already has 93 000 readers.

Internet and mobile telephony

Towards the end of the 20th century, the upsurge in mobile telephony preceded that of the internet, before the shift to mobile internet took place. The number of mobile phone lines increased from 0.1 million in 1990 to 11,4 million at the end of 2014, equating to 138 lines per 100 inhabitants. While the number of regular internet users (those who use the internet several times a week) aged 14 years and over was 0.7 million in 1998, this figure was 5.4 million at the beginning of 2015. The convergence can be clearly seen in the rapidly growing number of mobile phone users who access the internet via mobile broadband (3G+). The number of users rose from 1.2 million in 2010 to 3.6 million in 2014.

The ten largest libraries

A very large number of documents is accessible through libraries: In 2014, the ten most important libraries measured by their holdings had collections totalling more than 54 million copies.

Private households' expenditure on culture

In 2013 approximately CHF 10.1 billion was spent on culture per year. This is equal to an amount of CHF 238 per month and per household and a share of 4.3% of total consumer spending. At 74% or CHF 7.5 billion, spending on the media – e.g. on newspapers, books, television and internet subscriptions as well as on receiving and recording devices – accounted for the bulk of all cultural expenditure. Leaving media spending to one side, at CHF 775 million, the greatest expenditure goes to theatre and concerts.

Cultural funding by the public sector

In 2013, a fourth of total public spending on culture by the Confederation, cantons and communes, i.e. CHF 693 million, went to the sector "concerts and theatre". Some CHF 559 million was spent on the "Museums and Fine Arts" sector. This was followed by the sectors "Libraries", "Preservation of Monuments and National Heritage", "Mass media" and "Film and cinema", with contributions ranging from more than CHF 353, CHF 264, 148 to CHF 72 million.

Use of public spending by cultural sector, 2013

Film and cinema in Switzerland

In the early 2000s, approximately 1300 films were shown every year in Switzerland. Today this number is about 1700. During the same period, the share of Swiss films has increased from 10% to nearly 16%. In 2013, a total of 715 film production companies generated CHF 361 million with over 14 000 commissioned films (commercials, corporate films etc.) and independent films (cinema films, television films etc.). They employed over 1500 permanent employees, roughly a third of whom were women.

The political system

The Swiss Confederation, today made up of 26 cantons, has been in existence since 1848. The Government (Federal Council) is a collegial body consisting of 7 members (from 2016: 2 FDP, 2 SP, 2 SVP, 1 CVP). They are elected by both chambers in parliament: the National Council (representing the people, 200 seats) and the Council of States (representing the cantons, 46 seats). The Swiss political system is also characterised by far-reaching democratic rights (initiatives and referendums) and popular votes.

National Council Elections 2015

There were two winners of the national council elections in 2015: with a considerable increase in votes, the Swiss People's Party (SVP/UDC) which showed the greatest electoral strength (29.4%) achieved by a party since the first proportional representation vote in 1919 and secondly, the Radical Democratic Party/The Liberals (FDP/PLR) which increased its share for the first time since 1979. Losses were registered by the new centre parties, the Conservative Democratic Party (BDP/PBD), the Green Liberal Party (GLP/PVL) and the Christian Democratic People's Party (CVP/PDC) which reached a record low level. Therefore, the trend of the 2011 national council elections in which the emergent new centre parties (GLP/PVL, BDP/PBD) suppressed political polarisation was stopped, and to some extent reversed.

National Popular Votes

1 Includes counter proposals to popular initiatives
 2 Includes popular initiatives with counter proposals

Participation rate in national elections and referendums

1 These are average values for elections that took place within two years before and two years after the respective National Council elections. Until 1931, within one and a half years before and one and a half years after the elections, in accordance with the three-year cycle that was the norm at that time.

The strongest decline in voter turnout in national elections started after 1967, a trend which is not least of all attributable to the introduction of the women's right to vote. The decline in voter turnout in popular votes is subject to strong fluctuation, depending on the subject of the referendum. Since the 1990s, voter turnout fluctuated between the extremes of a minimum participation of 28% and a maximum of 79%. From the turn of the century on, voter turnout has somewhat stabilised, both for national elections, as for referendums; and is currently slightly rising (45%).

Public debt

The public spending ratio measures the expenditures of public authorities expressed as a percentage of gross domestic product (GDP). It includes expenditures by the Confederation, the cantons and municipalities as well as public social insurance funds (old age and survivors' insurance, disability insurance, maternity insurance and unemployment insurance).

Despite a considerable increase since 1970, in international comparison Switzerland is in a good position: it has one of the lowest public spending ratios of all OECD countries. Most European countries register markedly higher public expenditure.

Public spending ratio in % of GDP

Switzerland's public debt ratio is also relatively low compared with other OECD countries; between 1990 and 2003, however, it rose continuously. Thanks to a strong economic recovery until 2008, together with the shedding of surplus gold reserves of the Swiss National Bank as well as various structural measures (i.e. relief programmes, debt and expenditure brakes), the reduction of gross public debt was possible on an ongoing basis from 2005 to 2011. Debt increased again for the first time as of 2012. By the end of 2013, the debt ratio amounted to 34.6%.

► www.statistique.admin.ch → Thèmes → Finances publiques (not available in English)

Crime figures offer only a limited reflection of the reality of criminal behaviour: On the one hand, criminal standards and sanctions are affected by changes in society and on the other, crime figures are also strongly influenced by manpower resources, prosecution priorities, the efficiency of the police and justice system and the population's readiness to report crime. It is generally hard to determine which causes are responsible for changes in crime figures and to what extent.

Crime reporting

In 2014 the following number of offences were recorded in the Police Crime Statistics: 526 066 under the Swiss Criminal Code (SCC), 80 986 under the Narcotics Act (NarcA), 39 544 under the Foreign Nationals Act (FNA) and 12 521 under other federal legislation. The detection rate for homicides was 95%, for property offences 18%.

The breakdown by nationality and residence status shows that offenders were of Swiss nationality in 47% of Criminal Code offences, 55% of Narcotics Act offences and 59% of offences against other federal legislation. Foreigners with residence constituted 30%, 21% and 23% of offenders. This means that a substantial part of foreign delinquency is "imported", namely 23% (Criminal Code), 25% (Narcotics Act) and 18% (other). For offences against the Foreign Nationals Act, 82% of offenders were non-residents.

Offences according to Criminal Code titles 2014

Convictions

Whereas in the mid-1980s, slightly more than 45 000 convictions against adults were registered, this number has now more than doubled and in 2014 was approximately 110 100. Depending on the law under which the conviction was made, the trend varies greatly. In the last three years, an increase of 14% has been recorded for crimes against the Penal Code. With regard to the Road Traffic Act (SVG), ever increasing road traffic checks have led to more cases with convictions. The number of convictions against the Narcotics Act have been stable for several years. Convictions for crimes against the Foreign Nationals Act stabilised in 2014 following a continuous increase since 2000.

Selected offences SCC

1 Threat, coercion, trafficking in human beings, deprivation of liberty and abduction, hostage taking, unlawful entry

Selected offences RTA

1 Art. 90.2 RTA
2 Over the legal alcohol limit (Art. 91 Para. 1, Part 2 RTA)

Juvenile convictions

Convictions of minors show a falling trend (2010 to 2014: -18%). The number of illegal drug offences has increased while the number of traffic accidents, thefts and less serious violent crimes has fallen considerably. Serious violent crimes are stable at a low level.

Imprisonment

In Switzerland in 2015 there were 117 (mostly small) prison establishments with a total of 7343 detention places. On the reference day of 2 September 2015, 6884 persons were in detention. Thus, the total occupancy rate was 94%. Of the 6884 inmates, 66% were serving custodial sentences, 27% were in pre-trial detention, 5% were in detention subject to coercive measures under the Foreign Nationals Act, and the remaining 2% were detained for other reasons.

Prison population by sentence type

Recidivism

The reconviction rates of adults convicted in 2010 for crimes and less serious offences, over an observation period of 3 years (i.e. until 2013) was 24%, for minors 32%. The highest reconviction rates were for adults with two or more previous convictions (adults: 61%; minors: 61%).

Composition of gross income by household type, 2009–2011

Household budgets: Income

Averaged out over all households, income from employment at 76% represents the main component of household income. The second important component consists of pensions from the first and second pillars of the Swiss pension system and other social security benefits at 19%. The remainder of household income is made up of income from assets and transfers from other households.

The picture becomes more differentiated when the composition of household income is considered by household type. This shows, for example, that in households aged 65 and over, pensions represent the major part of the household income, but income from employment and, in particular, income from assets play a relatively important role. Transfers from other households represent an important source of income only in specific types of households, such as single-parent families, where the average amounts to 17%.

Household budgets: Expenditure

The variations in the composition of spending are less pronounced. Compulsory deductions, which comprise 29% of gross income, are the largest item. In the area of consumer expenditure, the largest item is expenditure on housing at 16%. Other large items include expenditure on food and non-alcoholic drinks, on transport and on entertainment, recreation and culture.

After all expenditure has been deducted, on average 12% of the gross income is left for saving. There are significant differences in this area depending on household type. Households over the age of 65 on average save less than younger households. Sometimes this figure is even a minus, which means that these households are living on their capital, among other things.

Composition of household budget, 2009–2011

Household expenditure over time

The composition of household expenditure has changed significantly over time. These changes are considerably larger than the differences between households today. For example, the share of total expenditure represented by expenditure on food and non-alcoholic drinks in 1945 was 35%, but nowadays this has fallen to 7%. In contrast the proportion of other expenditure has increased, such as expenditure on transport, which has risen from around 2% to more than 8%.

Trends in selected household expenditure items

Availability of selected consumer goods, 2013

Availability of consumer goods

Information about the availability of a selection of durable consumer goods shows that households in Switzerland are very well-equipped with IT hardware. A total of 93% of people live in a household with a computer and 97% in a household with a mobile phone. These proportions are continuing to rise: in 1998 only 55% of people lived in a household with a computer.

In the case of household appliances, such as dishwashers, washing machines and tumble dryers, there has also been an increase. In 2013 more than 84% of the population lived in a household with a dishwasher, while in 1998 the figure was only 61%.

Material deprivation rate by various socio-demographic characteristics, 2013

Material deprivation

The reasons for not owning a durable good are not necessarily financial. In 2013, only 1% of people living in Switzerland went without a computer for financial reasons; as far as owning a car for private use is concerned, this percentage was almost 4%. One of the most common material deprivation is caused by a lack of financial reserves. 20% of the population living in private households did not have the means to meet unexpected expenses of CHF 2500. This is followed by deprivation which affects the perceived inconveniences with regard to the residential environment. 16% of the population say that they are exposed to noise from neighbours or the street, 15% are confronted with problems of crime, violence or vandalism and 12% with a too wet accommodation. In addition, 9% of the population could not afford a week's holiday away from home each year.

Monetary poverty and risk of poverty

In 2012, 7.7% of the permanent resident population in private households in Switzerland was affected by income poverty. This corresponds to approximately 590 000 persons. The average poverty threshold, based on the social subsistence level, was approximately CHF 2200 per month for a single person and CHF 4050 per month for two adults with two children. According to the relative at-risk-of-poverty concept, 13.3% (2013) or some 1 035 000 persons were at risk of poverty. In 2013, the risk of poverty's threshold for a single person was approximately CHF 2560 per month for a single person (60% of the median of the equivalent available income) and CHF 5380 for two adults with two children.

Poverty of employed persons

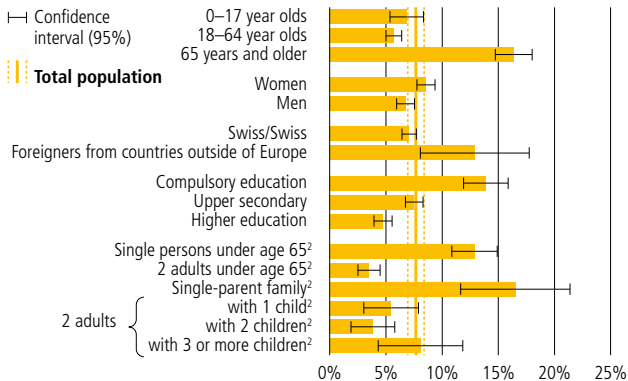

People living in households with high labour participation tend to have the lowest poverty rates. Successful integration in the labour market generally offers effective protection from poverty. Nevertheless, in 2012 some 3.5% or approximately 130 000 individuals were affected by poverty despite being in employment.

The phenomenon of working poverty is best understood in relation to the (longer term) security and insecurity of the employment situation. If working conditions and methods can be considered as clearly or tending to be insecure, the risk of poverty is greater.

Risk of poverty rate¹ by various socio-demographic characteristics, 2013

Poverty rate¹ by various socio-demographic characteristics, 2012

1 Based on the income without considering any assets
 2 Persons in a household with these characteristics

Inequalities in income distribution

Inequalities in income distribution are assessed on the basis of equivalised disposable income. This is calculated as follows: A household's compulsory expenditure is deducted from the household's gross income; the resulting balance is divided by the equivalent size of the household. Thus the equivalised disposable income acts as an index of people's standard of living, regardless of the type of household in which they live. In 2013, the equivalised disposable income of the wealthiest 20% of the population was four times greater than that of the poorest 20%.

Key data on gender equality

Are we on the road to sustainable development?

1 Meeting needs – how well do we live?

People's health is improving	  	Convictions for serious violent offences are increasing	  
Income are slightly increasing	  	Unemployment rate based on ILO definition is increasing	  

2 Fairness – how well are resources distributed?

Official development assistance is rising	  	The wage gap between women and men is gradually narrowing	  
The poverty rate decreases	  		

3 Preservation of resources – what are we leaving behind for our children?

Teenage reading skills are improving	  	The number of people working in science and technology is rising	  
Following an increase, public debt has fallen below its level in 1992	  	Populations of breeding birds are increasing	  
The share of investment in gross domestic product is about the same	  	The settlement area used per capita is increasing	  

4 Decoupling – how efficiently are we using our natural resources?

No significant change in the freight transport intensity	  	Per capita final energy consumption is decreasing	  
The public to total transport ratio is increasing	  	Material intensity is decreasing	  

Aimed evolution

-  Growth
-  Stabilisation
-  Decrease

Noted evolution

-  Growth
-  No marked change
-  Decrease

Assessment of trends since 1992

-  Positive (towards sustainability)
-  Unchanged
-  Negative (moving away from sustainability)

In most areas of life, beginnings for sustainable development have been assessed, but opposite trends can be identified as well. Thus, improvements made in eco-efficiency have often been compensated by an increase in consumption.

Fairness between generations is a current topic – the relatively positive assessment of the current situation could be at the expense of future generations. For example, around 14% of teenagers do not have even the minimum reading skills necessary to cope with modern daily life. Furthermore, the settlement area has grown mainly at the expense of valuable agricultural areas.

The **ecological footprint** measures the level of exploitation and limits of renewable natural resources. In 2011, the Swiss per-capita ecological footprint is almost three times larger than the world average per capita biocapacity. The main reason for the large footprint is energy consumption.

From a global perspective, economic development is still dependent on growing consumption of environmental assets and resources, which means that the higher a country's national income, the larger is its ecological footprint. The Swiss footprint is around the average of most Western European countries. The United States and some European countries consume almost four times the global capacity available, while South-East Asian and African countries consume considerably less.

Services for the population: spatial distribution and accessibility

The Federal Statistical Office has analysed the spatial distribution and accessibility of some thirty services that are important for everyday life. This study aims to observe the quality of life in the regions as well as regional disparities. Two results are shown as examples below.

Services in the communes, 2011

Percentage of communes with at least one establishment

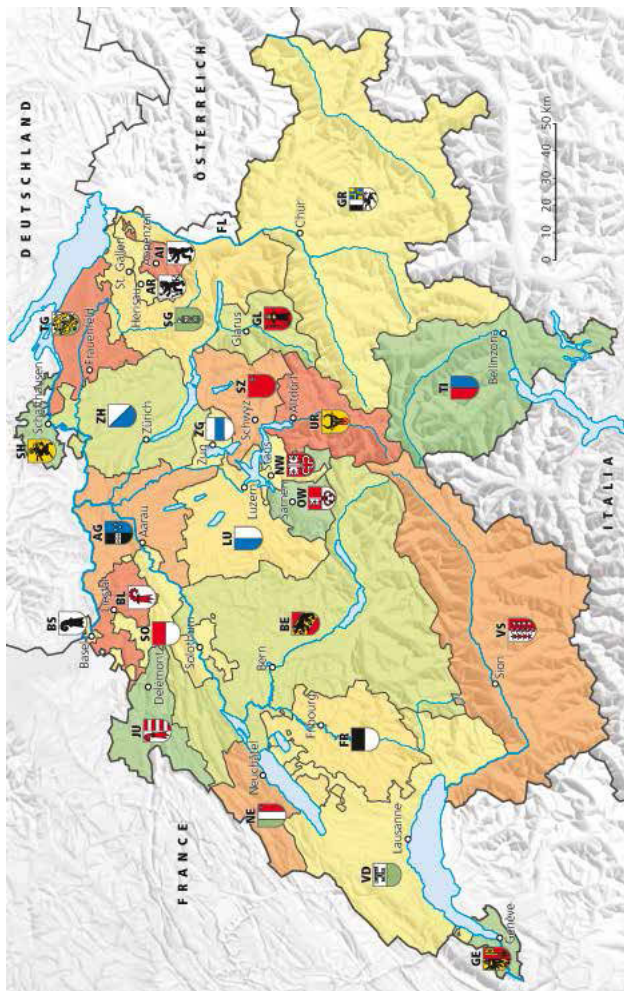

Mean distance to the nearest service, 2011

Distance calculated on the motorway network, in km

Statistical Yearbook of Switzerland 2016

The Statistical Yearbook of Switzerland is the standard reference work on Swiss statistics. It provides a comprehensive picture of Switzerland's social and economic situation and contains, along with numerous tables, illustrated overviews of all themes of public statistics. The whole yearbook is published in German and French; in addition, a cross-section summary with the most important statistical information is available in English and Italian. The latest results from the land use statistics are shown in map form in a separate chapter.

Published by the Federal Statistical Office. 616 pages (hardback), CHF 120. Available from bookshops or directly from NZZ Libro, the publishing house of the Neue Zürcher Zeitung. Email: nzz.libro@nzz.ch

Graphical Statistical Atlas of Switzerland 1914–2014

The "Graphical Statistical Atlas of Switzerland 1914" is one of Switzerland's earliest and most comprehensive thematic national atlases. It is also an excellent graphical compendium of the first 50 years of official statistics in Switzerland. To mark the 100 year anniversary of its publication, the Federal Statistical Office has fully reproduced this impressive but still difficult to obtain work. In doing so, the FSO aims to make the atlas accessible to the wider general public.

At the same time, the original tables from 1914 have been completed by new statistical maps and diagrams with up-to-date figures from the same topics in 2014. In the form of a supplement, the atlas offers direct comparisons and an exciting visual journey through time, illustrating Switzerland's social and spatial structures a century ago and today.

Published by the Federal Statistical Office. 130 pages (hardback), CHF 89 (incl. VAT). Available at the Federal Statistical Office. Email: order@bfs.admin.ch

The [Swiss Statistical Portal](http://www.statistics.admin.ch) (www.statistics.admin.ch) is the comprehensive online service for Swiss public statistics. The portal makes available press releases and publications from the Federal Statistical Office (FSO) and other public statistical offices, as well as continually updated detailed results presented in the form of indicators and downloadable tables. Attractive maps and atlases are included in the "Regional" and "International" chapters. By subscribing to the NewsMail service or to automatic RSS feeds, users can keep up to date about our wide range of offerings. As of 2011, in addition to the four languages already present on the statistics portal (German, French, English and Italian), there are also some pages in Romansch.

The Mini Statistics Portal <http://mobile.bfs.admin.ch>, a new service introduced by the Federal Statistical Office (FSO) in 2010, provides the most important statistical figures also for mobile devices.
